COE768: Guidelines for Writing Project Formal Report

The following guideline is for your reference only. It describes what should be included in the project report. The basic criterion is that someone who does not have any prior information about the project must be able to follow your report. Furthermore, your report must convey all relevant observations and results.

1) Introduction
   - What is the project about?
   - Background information on socket programming.

2) Description of the client and server programs
   - The basic approach to implement the protocol;
   - Detailed description of the programs.

3) Observations and analysis
   - Test your implementation and present your observations and analysis
4) Conclusions

5) Appendix
   Source codes of your programs with appropriate comments.

There is no pre-determined length for a report. However, the best report is the most concise one which also happens to be complete. Only typed or type-set reports are acceptable.
